

Story 5	The Team's Smart Assistant
Story Title	The Team's Smart Assistant
Meta Goal	To transition the learner from building personal automations to designing simple, trustworthy AI-enabled systems for other users.
Target Audience	Experienced AI users (Levels 3-4) who are ready to build solutions for their teams or clients.
Time	9 minutes (Storytelling: 4 min, Trust Principles: 5 min)
Context	AI Literacy, Level 5
Version	/
Starting Competence	Conscious Competence (Can build a personal workflow).
Ending Competence	Conscious Incompetence (Understands the key principles of trustworthy AI design—RAG, citations, oversight—but has not yet implemented them in a real system).
Story Objective	Learners grasp that building for others requires a focus on “designing for trust,” and can name the three core principles (Grounding, Citing Sources, Human Oversight).
Essential Question	When an AI gives an answer to your colleague, how do they know they can trust it? How do you, the designer, make that trust possible?
Anchor Question	“Your personal workflow is great, but how would you need to change it before you'd let your CEO make a decision based on its output?”
Story Arc	Setup: You've built an amazing workflow that saves you an hour a day (L4). Your team is impressed. Your boss says, “Great! Let's roll it out to everyone.” Tension: A moment of panic. A workflow built for you is a hack. A system used by others is a responsibility. What if it fails silently? What if it's subtly biased? How do they know it's right? Disruption: The focus shifts from personal productivity to socio-technical design. The three pillars of trust are introduced: Ground the AI (RAG), Make it Show Its Work (Citations), and Provide an “Eject Button” (Human-in-the-Loop). Insight: Building for others isn't about better prompts; it's about building a transparent, verifiable <i>system</i> around the AI. The most important feature is trust, and trust is a design choice.
Teaching Tools	Slide visuals (“Personal Hack” vs. “Team Solution”), diagram of RAG architecture, example of an answer with/without citations.
Teaching Situation	Full group lecture, followed by a final reflective design exercise.

Story 5 The Team’s Smart Assistant

Tension & Friction	Confronting the responsibility that comes with building systems for others. The realization that a “good enough” personal tool is not good enough for a team, and that systemic risks (like bias at scale) are now their problem to solve.
Exercise	“Let’s go back to that purchasing manager. They need to verify supplier
Hook	compliance with a new regulation. On paper, design a simple ‘Compliance Bot’ for them. What documents will you use to ground it? What will a trustworthy answer look like? Where is the ‘eject button’ for the manager?”
Teaching Core	Learners engage in a high-level system design task, forcing them to think about user needs and apply the principles of trust. They experience the shift from thinking about “my workflow” to “their experience,” the final step in the journey.
